

BLA-03 · MANAGING MODELS

Managing Models with Amazon SageMaker AI

Bedrock or SageMaker? · The life of a model · Deploying safely · Keeping track
· Checking it's still right

Smita Krishnan · AWS Generative AI Developer · Concordia University Chicago

PART

01

Bedrock or SageMaker?

Amazon Bedrock	Amazon SageMaker AI
Use a ready-made model	Train, tune or host your own
AWS runs everything	You choose the machines
Pay per request	Pay for machines while they run
Fastest way to start	Most control

A support chatbot on Claude → Bedrock

A fraud model trained on your own transactions → SageMaker

The life of a model

SageMaker covers every stage — and the last one loops back to the first.

A model isn't finished when it's trained. It's finished when it's retired.

Deploying without breaking things

Strategy	What happens
All at once	Everyone gets the new model immediately
Canary	A small slice gets it first — then everyone, if it's fine
Linear	Traffic moves over in steady steps
Blue/green	Old and new run side by side, then you switch

✓ **Auto-rollback:** if an alarm goes off during the rollout, SageMaker switches back on its own — nobody has to notice at 2 a.m.

Hosting a model without wasting money

Endpoint type	Best when...
Real-time	Someone is waiting for an answer now
Serverless	Traffic comes in bursts, with quiet gaps
Asynchronous	Big requests that take minutes
Batch	Scoring a whole file, often overnight

Big models need big machines. A smaller, compressed version of the model — or several models sharing one machine — both cut the bill.

Keeping track of every version

Tool	What it records
Model Registry	Every version — approved, live, or retired
Lineage tracking	The family tree: which data, code and settings made it

An auditor asks: "What data trained the model that rejected this loan?"

With lineage, that's a lookup. Without it, it's a guess — and a guess isn't an acceptable answer.

Checking it's still right

Tool	What it does
Ground Truth	People label data so a model can learn from it
Model Monitor	Warns when live data drifts from the training data
Clarify	Checks for bias and explains predictions

Other tools worth knowing

Tool	In one line
JumpStart	A shop of ready-made models you deploy in a few clicks
Pipelines	Automates the whole life cycle, step by step
Unified Studio	One workspace for data, analytics and AI
Neo	Shrinks a model to run on small devices

Neo example: a camera on a factory line spotting faulty parts — without sending every image to the cloud.

Key takeaways

- 1 Bedrock to use a model · SageMaker to own one
- 2 Prepare → Train → Register → Deploy → Monitor
- 3 Roll out to a few users first — let alarms roll back
- 4 Don't pay for an idle real-time machine
- 5 Lineage turns an auditor's question into a lookup
